

# Nyaya Mitra - Lawyer Meeting: Complete Context Analysis

Detailed explanation of the lawyer's feedback, recommended product changes, strategic implications, and the later professor/team discussion. Based on the provided TurboScribe transcription.

**Important speaker distinction:** The main sections below explain the lawyer's recommendations. The later RTI / government-circular / MLA / pothole / directory discussion is kept separate because it occurred after the primary lawyer discussion and should not automatically be treated as a Nyaya Mitra requirement.

## Executive Takeaway

The lawyer did not reject Nyaya Mitra. He considered the core idea valuable and workable, but he challenged the current framing, stakeholder model, assumptions about government data access, advocate assignment model, and the project's understanding of real legal workflows.

**The central change:** Nyaya Mitra should evolve from a narrow undertrial bail-eligibility tool into an **accused-centric legal-services coordination and case-information platform**, with the undertrial workflow remaining the initial operational wedge.

**Core lifecycle:** Police / Jail / Court / DLSA / SLSA / Legal Aid -> Nyaya Mitra -> Accused Profile + Legal Need Detection + Documents + Eligibility Review + Human Action + Status Tracking -> Accused.

## 2. His first major recommendation: GET REAL JAIL DATA

This was probably the single biggest point in the entire meeting.

The lawyer asked you to think about what happens in reality.

### He gave an example:

Suppose according to your system a person has been in custody for three years and reaches some relevant legal threshold.

Then what happens?

### The system cannot stop at:

"This person is eligible."

The actual world has to move.

The lawyer wants the system to know things like:

How many prisoners are currently in the jail?

Who are they?

What cases are they involved in?

Who needs legal assistance?

Who has an advocate?

Who doesn't have an advocate?

Who is being released?

Which people require assistance?

He explicitly said the system should get real-time data about the jail population, releases and requirements.

## Why he said this

### Because he sees the biggest problem not as:

"AI doesn't know who is eligible."

### Instead, he sees the problem as:

"The relevant authorities do not have an efficient system connecting prisoner information to legal assistance."

That is a much bigger product opportunity.

## 3. He wants jail authorities to become a DATA FEEDER

This is a huge architectural change.

He suggested that your system should provide access for jail authorities to enter/maintain prisoner information.

### For example:

number of prisoners

cases

legal requirements

whether an advocate is needed

prisoner information

family information

health information

relevant case information

Then that information flows to the legal-services ecosystem.

### His suggested chain was roughly:

Jail Authority → Nyaya Mitra → DLSA/SLSA → Defence Legal Aid Advocate → Prisoner

The lawyer explicitly described jail authorities updating that a particular accused needs an advocate and then the defence legal-aid system taking over.

This means your product isn't just an AI layer anymore.

It becomes an information and coordination layer between institutions.

## 4. Very important: he expanded the scope beyond UNDERTRIAL prisoners

This was another major suggestion.

### He said there are two broad categories:

Undertrial prisoner

A person whose case is still being tried.

Convicted prisoner

A person who has already been convicted.

### He then said:

After conviction, there can be a problem in getting an appeal.

And therefore there is another opportunity.

He suggested that Nyaya Mitra could eventually help with:

Appeal assistance

### **For example:**

Jail → Appeal requirement → High Court

### **or potentially:**

High Court → Supreme Court

He specifically mentioned helping with applications for appeals and providing copies of disposed judgments/case materials.

This is important strategically.

### **He was NOT saying:**

“Forget undertrial prisoners.”

### **He was saying:**

Start with the undertrial problem, but build the platform in a way that can eventually serve the broader prisoner/legal-aid lifecycle.

That gives you a much stronger long-term roadmap.

## **5. He explicitly told you to create an ACCUSED PROFILE**

This is one of the clearest feature recommendations.

He suggested creating an accused-centric profile.

### **The profile could contain things such as:**

Basic information

Identity and case information.

Family

Family information/history.

Health

Health status or relevant health information.

Legal information

Case details, legal status, etc.

Documents

Copies of relevant case documents.

He later says that even after a person is released, the person could continue to use their case information and take it to an advocate, with the case details and charge-sheet soft copy available.

### **This is actually a very powerful product idea.**

### **Your current concept is:**

System detects eligibility.

### **His idea is closer to:**

Nyaya Mitra becomes a persistent digital legal record and assistance layer for the accused.

## **6. He questioned the practicality of getting police/jail data**

This was probably the most important reality check he gave you.

### **Someone raised the issue that:**

How will you obtain this data?

### **The lawyer's response was essentially:**

Police and jail authorities will NOT simply hand over their existing data to a private project.

### **He specifically questioned:**

Why would police give data to a private person?

and pointed out that authorities are not going to casually share sensitive information.

### **This means your previous product assumption:**

"We'll obtain jail data and run AI over it."

is not sufficient.

You need a much more credible institutional deployment model.

## **7. His solution to the data problem is brilliant**

He didn't stop at saying data access is hard.

### **He suggested:**

### **Don't go to jail authorities saving:**

"Give us your data so our AI can work."

### **Instead:**

Give the jail authorities something useful in return.

### **He gave an example:**

Nyaya Mitra could maintain useful prisoner information such as:

blood group

family information

family history

health status

accused profile

case information

Then the jail itself gets operational value.

### **He essentially said:**

If you give jail authorities useful first-hand information, they will be much more willing to work with you.

He explicitly reasoned that jail authorities and government authorities themselves have an interest in having this organised information.

### **This changes your go-to-market strategy.**

#### **Instead of:**

AI company → asks government for data

#### **you want:**

Nyaya Mitra → solves an administrative problem for government → government becomes the data/institutional partner.

That's significantly more realistic.

## **8. He told you to change your STAKEHOLDER MODEL**

He was extremely explicit here.

### **He said your stakeholders should be:**

Police stations

Jails / prison authorities

Courts

DLSA

State Legal Services Authority

Defence Legal Aid

Government/NIC/eCourts systems

### **He also specifically brought up:**

NJDG — National Judicial Data Grid

and asked whether you had looked at it.

### **So your stakeholder diagram shouldn't be:**

Prisoner → AI → Lawyer

### **It should look more like:**

Police + Jail + Court Data + DLSA/SLSA + Legal Aid Advocates + Prisoner

with Nyaya Mitra sitting in the middle as the coordination/intelligence layer.

That is a MUCH stronger enterprise/public-sector story.

## **9. He asked you to investigate LegalIT**

He repeatedly told you to look at something he called:

LegalIT

He described it as a system/platform providing end-to-end services to advocates.

### **His point was not:**

"Copy LegalIT."

### **His point was:**

Understand what already exists in the legal-tech market.

He specifically mentioned services around advocate workflows, billing/invoices and case-related services.

This means before you add advocate-centric features, you need to answer:

What is Nyaya Mitra doing that existing advocate platforms are not?

That becomes part of your competitive differentiation.

## **10. He challenged your ADVOCATE MARKETPLACE idea**

This portion is extremely important.

### **The discussion moved toward:**

What if advocates register on the platform and prisoners get advocates?

The lawyer immediately identified problems.

Problem 1 — Advocate quality

A newly registered advocate may have very little experience.

So if someone simply registers and gets assigned a serious criminal case:

Who decides whether this advocate is appropriate?

He specifically raised the issue of a one-year-old advocate registering and being assigned a case.

Problem 2 — Prisoner trust

The accused may not want to accept an inexperienced advocate.

Problem 3 — Advocate credentials

### **You need information such as:**

experience

practice area

criminal-law experience

professional record

He suggested investigating whether such advocate records could potentially be obtained from government sources.

Problem 4 — PAYMENT

### **He directly asked:**

Who will pay the advocate?

Because advocates normally charge fees.

This exposes a major flaw in any simple “connect prisoner with advocate” marketplace model.

## **11. He challenged your REVENUE MODEL**

### **At one point he explicitly asked:**

Have you thought about the revenue point of view?

This means he wasn't only thinking as a lawyer.

## He was thinking:

Can this become a sustainable system?

However, in the later discussion he strongly leaned toward the system being a:

NON-PROFIT / SOCIAL-IMPACT ENDEAVOUR

He literally says that the system should work in a non-profit setting.

He also gave a rough idea that the system's annual maintenance could be relatively modest compared with the public value it creates, and suggested there could be funding opportunities because you're solving a substantial social problem.

So the model he seems to be imagining is closer to:

Government / DLSA / institutional adoption + grants/CSR/social funding

## rather than:

Prisoner pays → advocate marketplace → commission.

That's a big distinction.

## 12. He praised the AI idea

This shouldn't get lost among all the criticism.

## He explicitly said:

"It's brilliant."

## and also said:

"within very short time they have understood the system."

Then he said that he believed no one had really come out with a system using AI in this particular way to benefit accused persons.

So the lawyer liked the fundamental idea.

## The problem wasn't:

"AI in law is useless."

## The problem was:

"Your current implementation doesn't yet reflect how the legal system actually operates."

That's a VERY different criticism.

## 13. He strongly liked the ACCUSED-BENEFIT angle

## This is probably one of the strongest validation points.

He says the best part is that you're using AI to benefit accused persons, not simply lawyers or courts.

That gives Nyaya Mitra a distinctive social-impact identity.

Your pitch should therefore be careful not to make it look like:

"AI software for lawyers."

## The stronger story is:

AI-powered legal access infrastructure that helps authorities and legal-aid systems ensure accused persons do not fall through administrative gaps.

Then lawyers are one of the key professional users.

## 14. He wants the system to continue helping AFTER RELEASE

### This is another excellent point.

He says that even after a person is released — for example through bail — the person can still use the system.

The case details remain available.

The charge sheet can remain available in soft copy.

And the person can take the information to an advocate later.

This means the lifecycle shouldn't necessarily end at:

RELEASE → DONE

### Instead:

RELEASE → DIGITAL CASE RECORD → FUTURE LEGAL ASSISTANCE

That creates a much more powerful long-term product.

## 15. He was VERY skeptical about your understanding of how courts actually work

There is a section where someone asked something along the lines of:

How would the system handle a rejected bail / court process?

The response became quite strong.

### The lawyer essentially said:

Real court processes are nowhere near how legal systems are portrayed in entertainment or web series.

He said that these representations are far away from reality and that you shouldn't design the system based on simplified assumptions.

This is actually a very valuable warning.

### Translation for your development team:

#### Do not build:

"AI → submits bail → court instantly responds → prisoner released."

#### Real legal workflows involve:

procedural stages

human actors

documentation

hearings

delays

administrative processes

different authorities

court-specific processes

legal representation

So your court workflow needs to model reality, not create an idealised automation story.

## 16. He questioned your use of AI/ML WITHOUT historical data

This came up after the lawyer conversation.

Someone discussed the problem of getting old data.

### The key point was:

If you want to train AI/ML systems properly, you need previous data.

The discussion recognised that without historical data, many ML claims become difficult.

### This is an important distinction for your project.

### You should NOT say:

“Our ML predicts everything from historical prisoner data.”

unless you actually have the required data.

### Instead your architecture can use:

Rules + verified legal knowledge + RAG + AI extraction + workflow orchestration

while gradually building an anonymised evaluation corpus.

That is much more defensible.

## 17. The professor/team discussion after the lawyer left

This part is important because not everything after the thank-you exchange should be attributed to the lawyer.

After the lawyer's closing remarks, the conversation becomes much more exploratory.

They discuss additional possible civic/legal-tech ideas, including:

AI-assisted RTI application generation

Someone suggests a website where a user tells the system what information they need and the system determines the relevant authority/department and prepares the RTI application.

### Then they discuss:

Government orders and circulars

For example, government rules changing over time, such as age criteria for school admission.

### The idea is:

Government circulars and orders should be collected and kept updated in one place.

### Then another idea appears:

Citizens communicating with elected representatives

### For example:

People in a constituency could raise questions/issues to their MLA.

They also discuss using AI/computer vision to detect things such as potholes from road videos and route the complaint to the appropriate department.

And finally they discuss a directory/notice-board concept where information from different websites could be collected centrally.

These are NOT necessarily changes requested for Nyaya Mitra.

They are additional ideas discussed after the primary conversation, and you should not merge them into Nyaya Mitra unless you deliberately decide to build a larger civic/legal-information platform.

## 18. The very end is actually extremely encouraging

At the end, the professor/team discusses the practical API question:

If different government websites expose APIs, could their information be connected?

### The answer is essentially:

Yes, technically, where APIs actually exist and access is permitted.

They talk about identifying relevant domains, checking their APIs, and potentially integrating them.

The “directory” idea then comes up again.

### Finally, someone says:

“You must change the stakeholders.”

### And then:

“I think this is a workable solution.”

Most importantly, the lawyer offers a potential institutional path:

He says that if you develop something concrete, he can put you in touch with a member secretary of the State Legal Services Authority, who could then help you with the necessary government/jail/police paperwork and access process.

This is potentially the most valuable outcome of the entire meeting.

### The meeting did not end with:

“Your idea isn’t practical.”

### It ended much closer to:

“Make it concrete, change the stakeholder model, and then there is a potential path into the legal-services system.”\\

## What the Lawyer Wants Changed - Final Summary

| Current framing                                 | Lawyer's direction                                                                               |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Undertrial bail eligibility as the main product | Accused-centric legal-services coordination platform; undertrial workflow remains the initial we |
| Prisoner -> AI -> lawyer                        | Police + Jail + Court + DLSA/SLSA + Legal Aid + Accused, with Nyaya Mitra as coordination/in     |
| Assume government data will be available        | Provide institutional value first; obtain data only through legitimate/authorised channels       |
| Simple advocate connection                      | Institutional/legal-aid assignment with verified panel/experience information where available    |
| Case ends at release                            | Preserve an appropriate legal record and support future legal assistance                         |
| AI-focused product                              | Operational workflow supported by AI, with human legal responsibility                            |
| Court workflow as simplified automation         | Model real procedural stages, delays, documents, hearings and institutional actors               |
| Single undertrial category                      | Undertrial first; architecture expandable to convicted-prisoner appeal assistance                |

## Most Important Product Interpretation

**The lawyer's message is not “build more AI.” It is “make the system fit the real legal ecosystem.”**

The strongest interpretation is that Nyaya Mitra should help make sure an accused person's legal needs do not disappear inside fragmented institutional workflows. AI should support document understanding, evidence grounding, prioritisation, drafting assistance and tracking, while legal professionals and institutions retain responsibility for consequential decisions and actions.

## Speaker Attribution Note

The transcription becomes more exploratory after the closing/thank-you exchange. The later ideas around RTI generation, government circulars, constituency communication, pothole detection and a cross-website directory are therefore included in this document for completeness but are **not treated as confirmed Nyaya Mitra requirements**.
